
Water maser bowshocks: Episodic activity in massive young stellar objects

Ross Burns
Joint Institute for VLBI ERIC (JIVE)

Toshihiro Handa, Tomoya Hirota, Hiroshi Imai

JIVE
Joint Institute for VLBI ERIC

Massive stars

- Enrich the ISM (produce elements >Fe)
- Inject turbulence (mechanical feedback)
- Ionizing radiation (raditative feedback)

- Angular momentum problem
- Radiation pressure problem
- Luminosity problem

Massive SF is not fully explained.

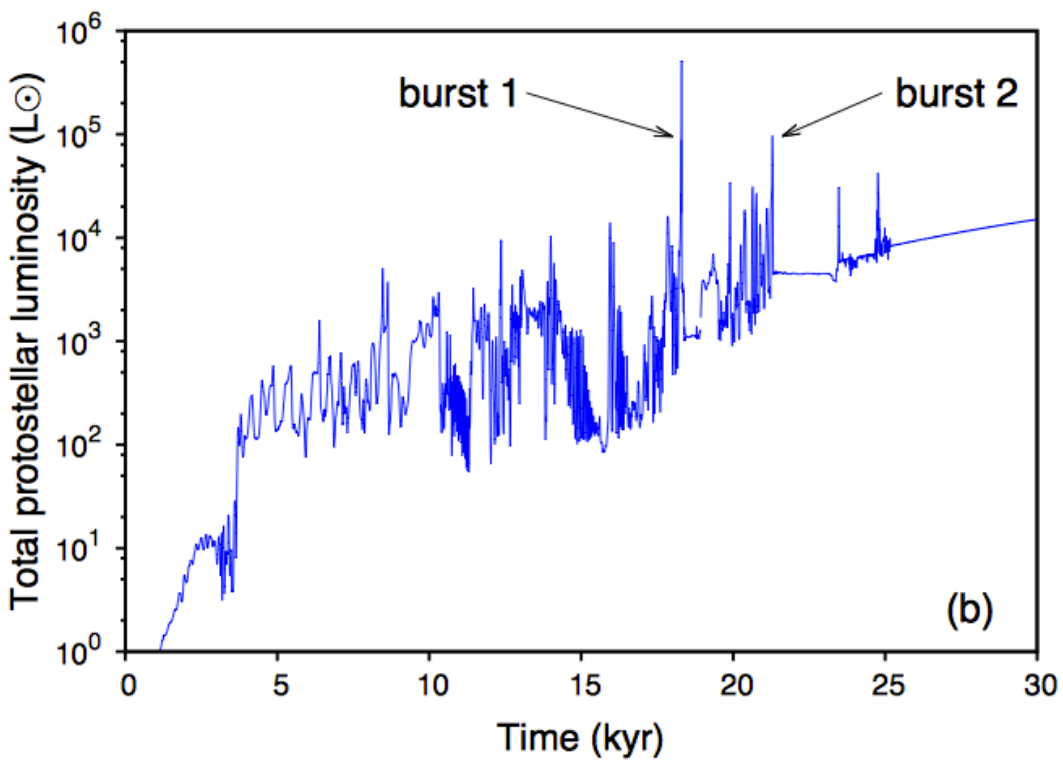
FUori process present in massive YSOs? "MUors"?

Episodic acc.: High mass YSOs

Simulations



Meyer+ 2017 Predict episodic accretion timescales of 10^4 yr

Similar to low-mass case (sim. and obs.)

NGC6334I S255

Importance of Episodic acc.

How about the "Radiation pressure problem"?

In massive stars, radiation pressure is high enough that it should stop accretion beyond 8 $M_\odot$

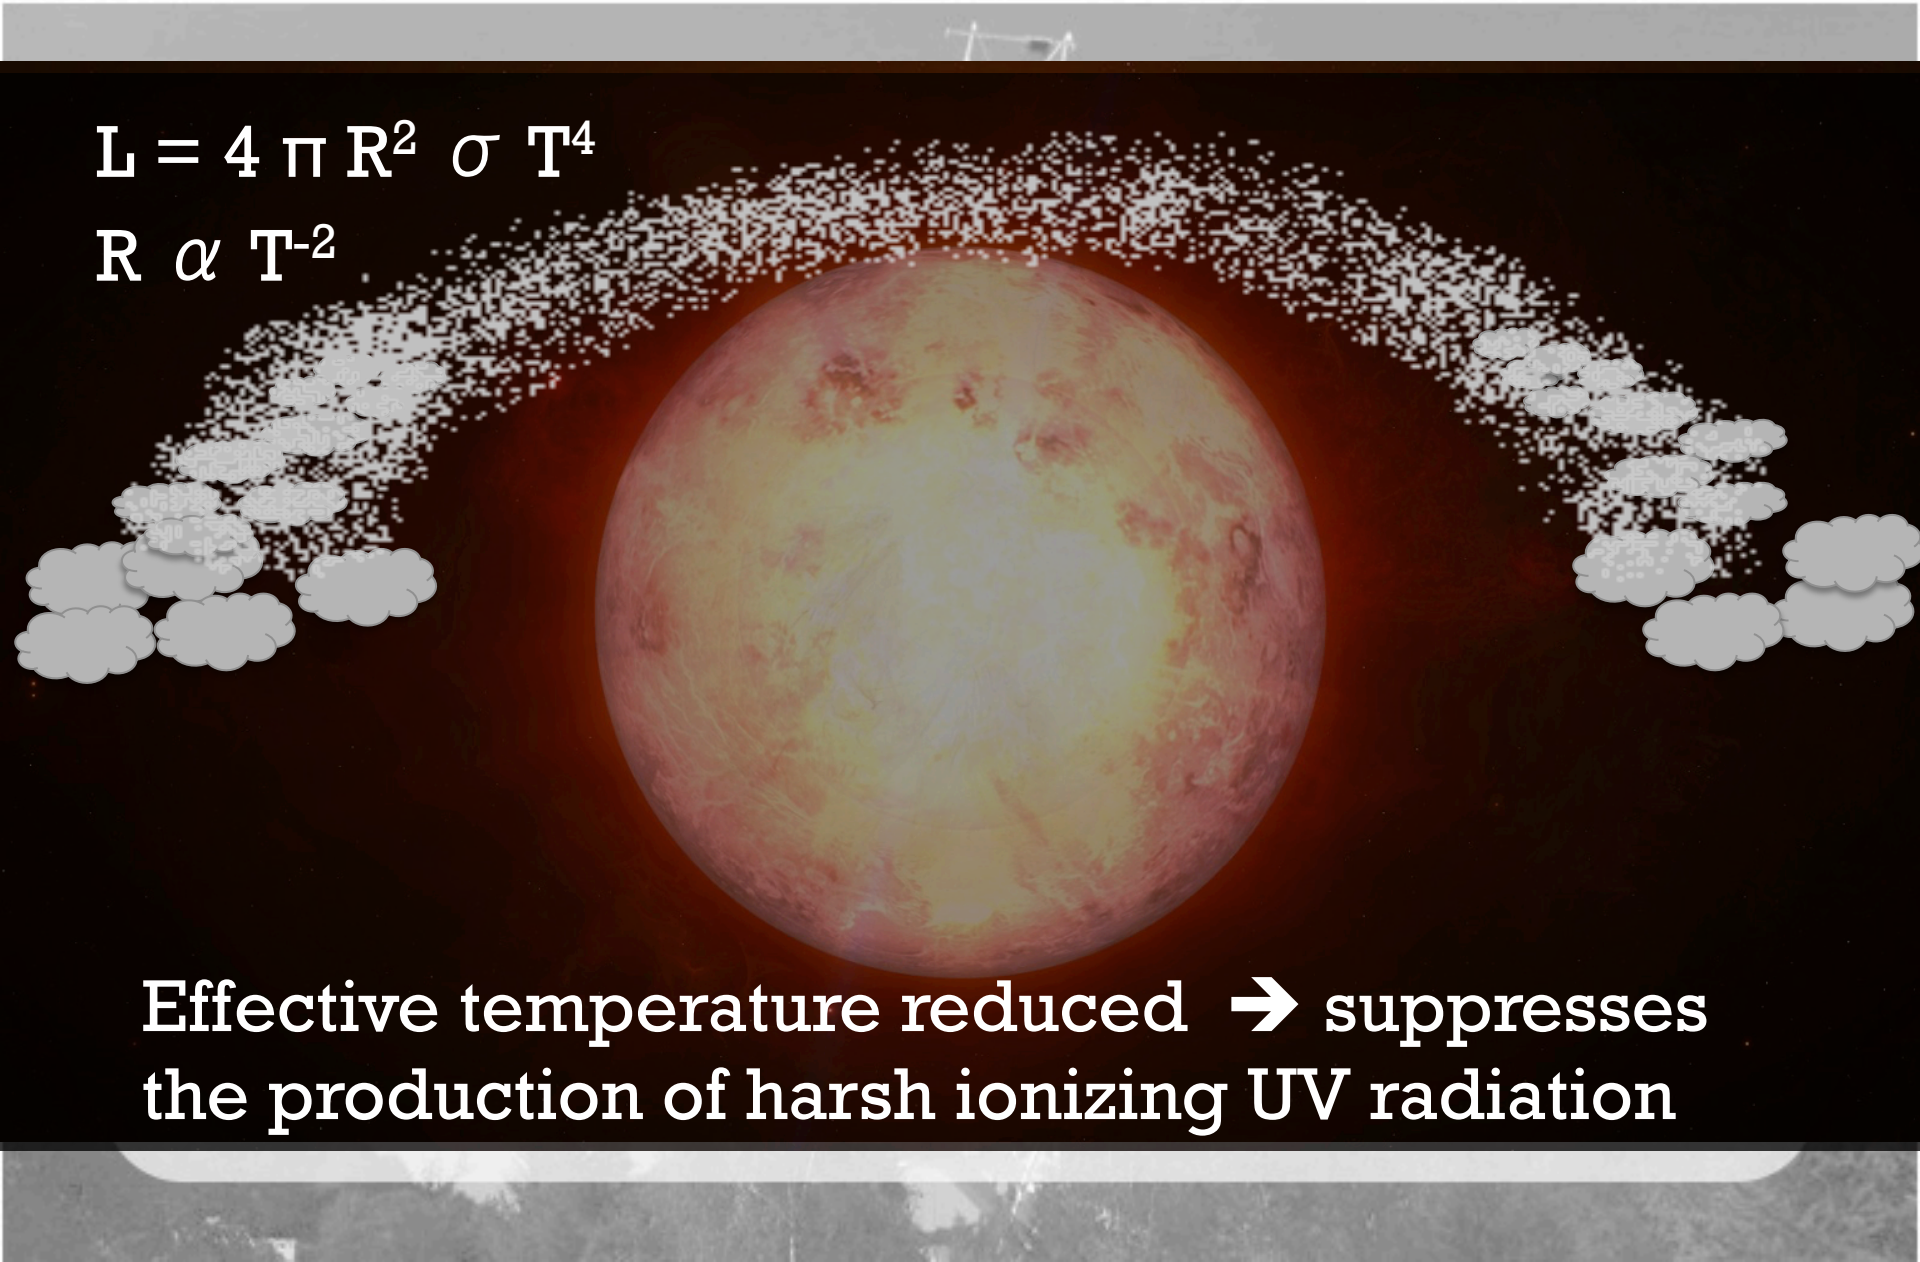
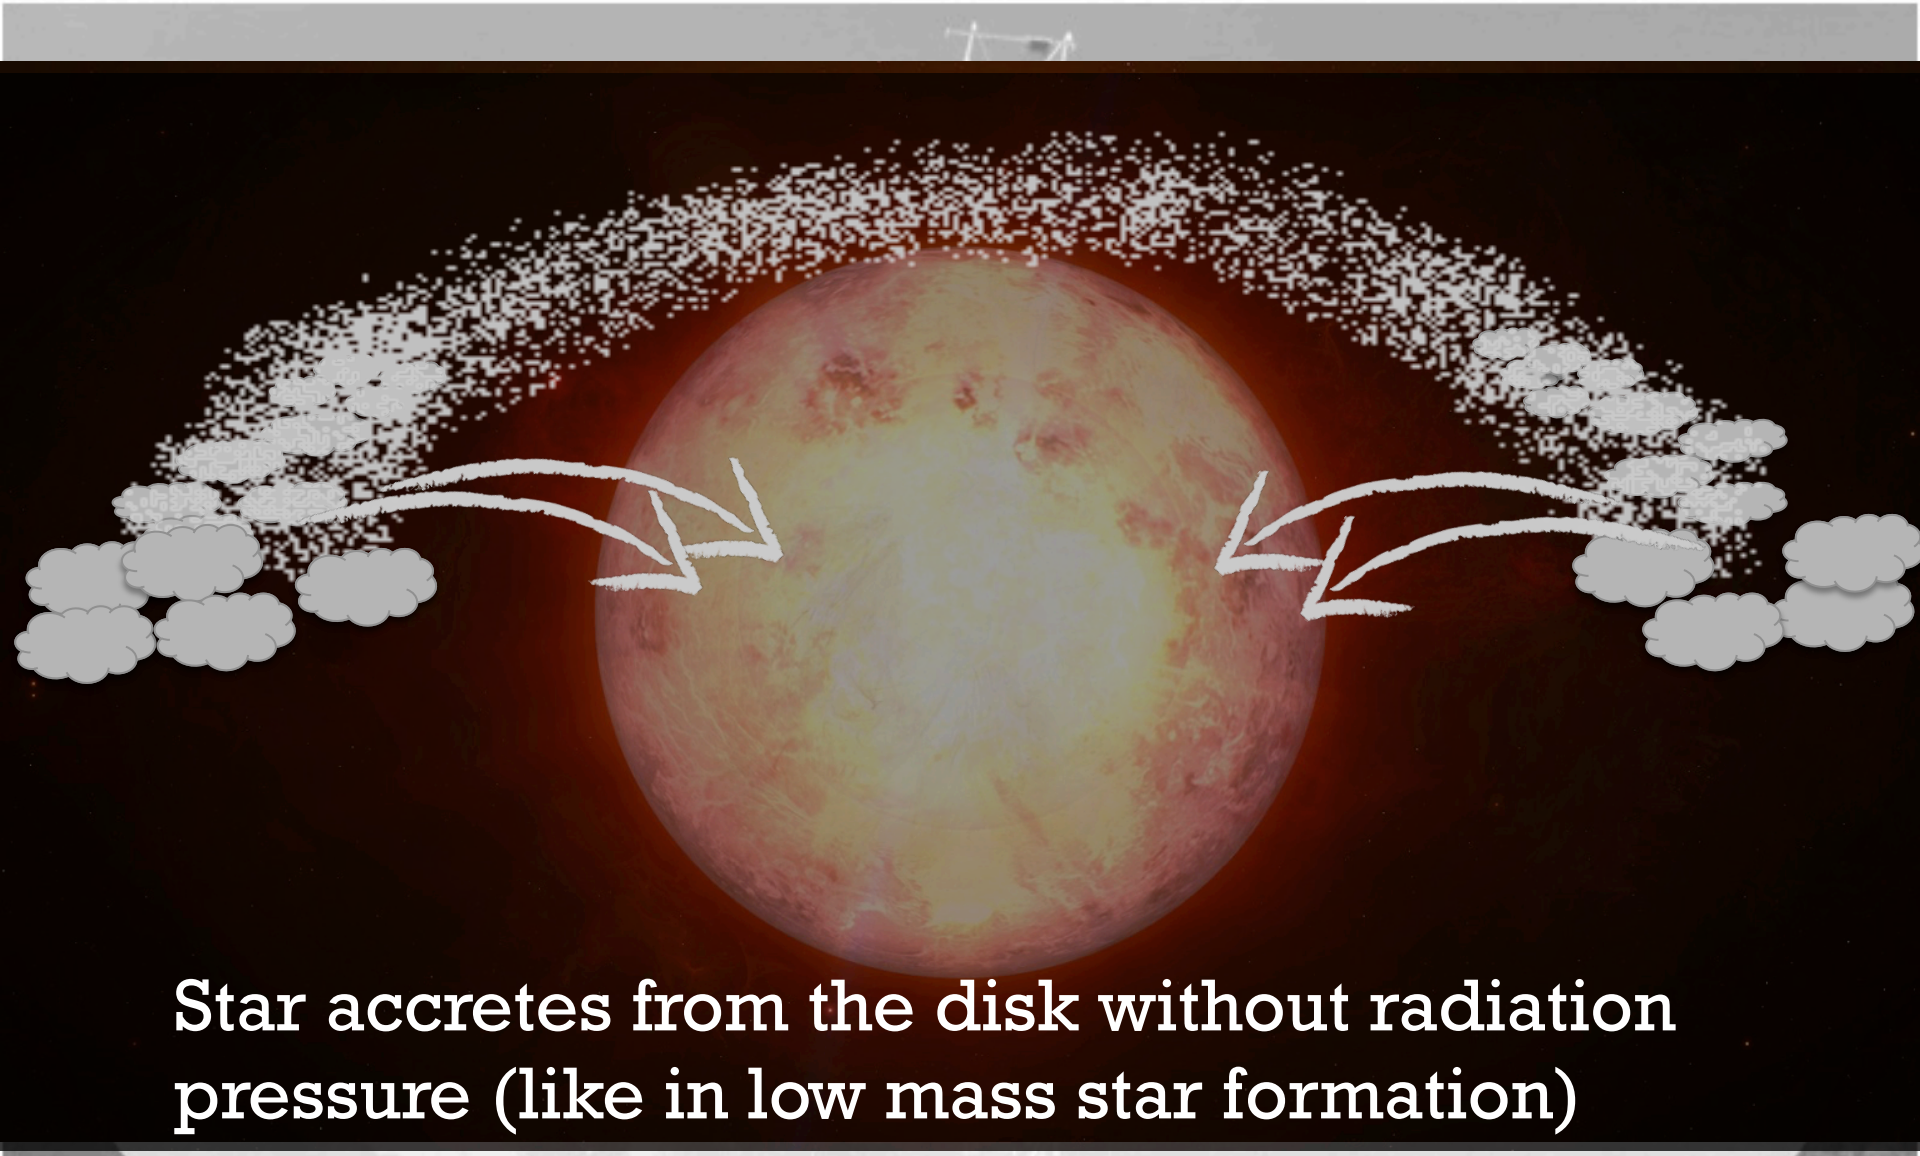
Fragment

JIVE
Joint Institute for VLBI
ERIC

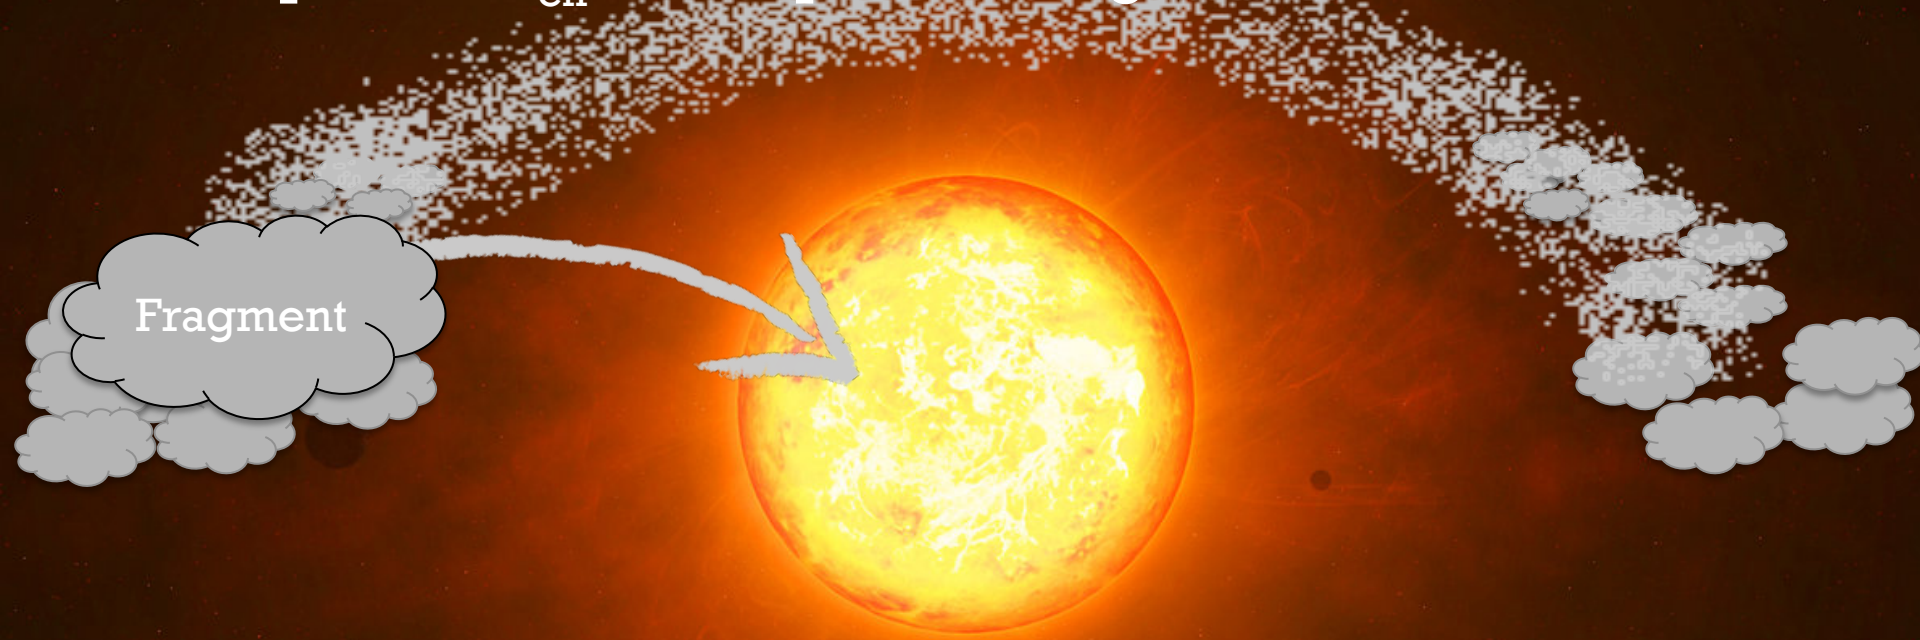


Effective temperature reduced → suppresses the production of harsh ionizing UV radiation



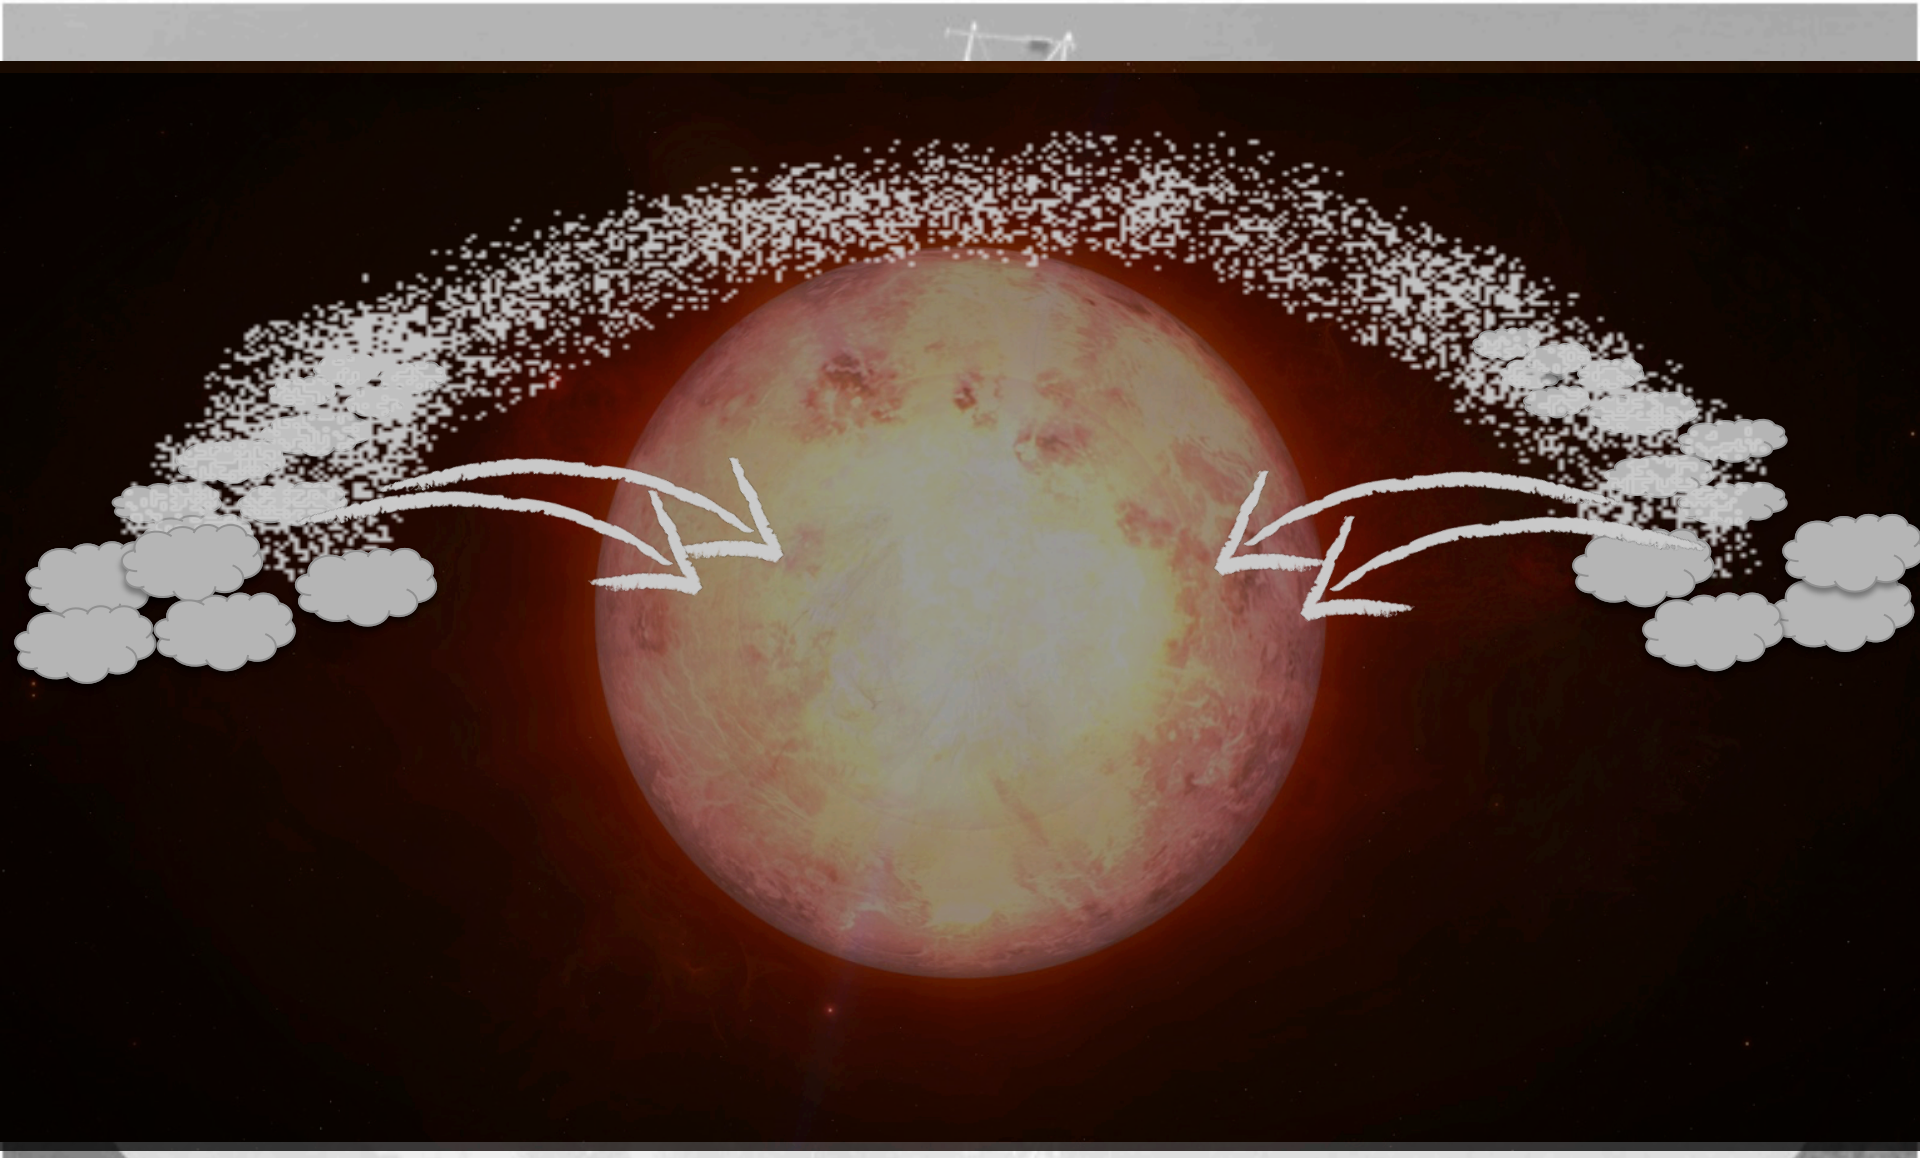
Star accretes from the disk without radiation pressure (like in low mass star formation)

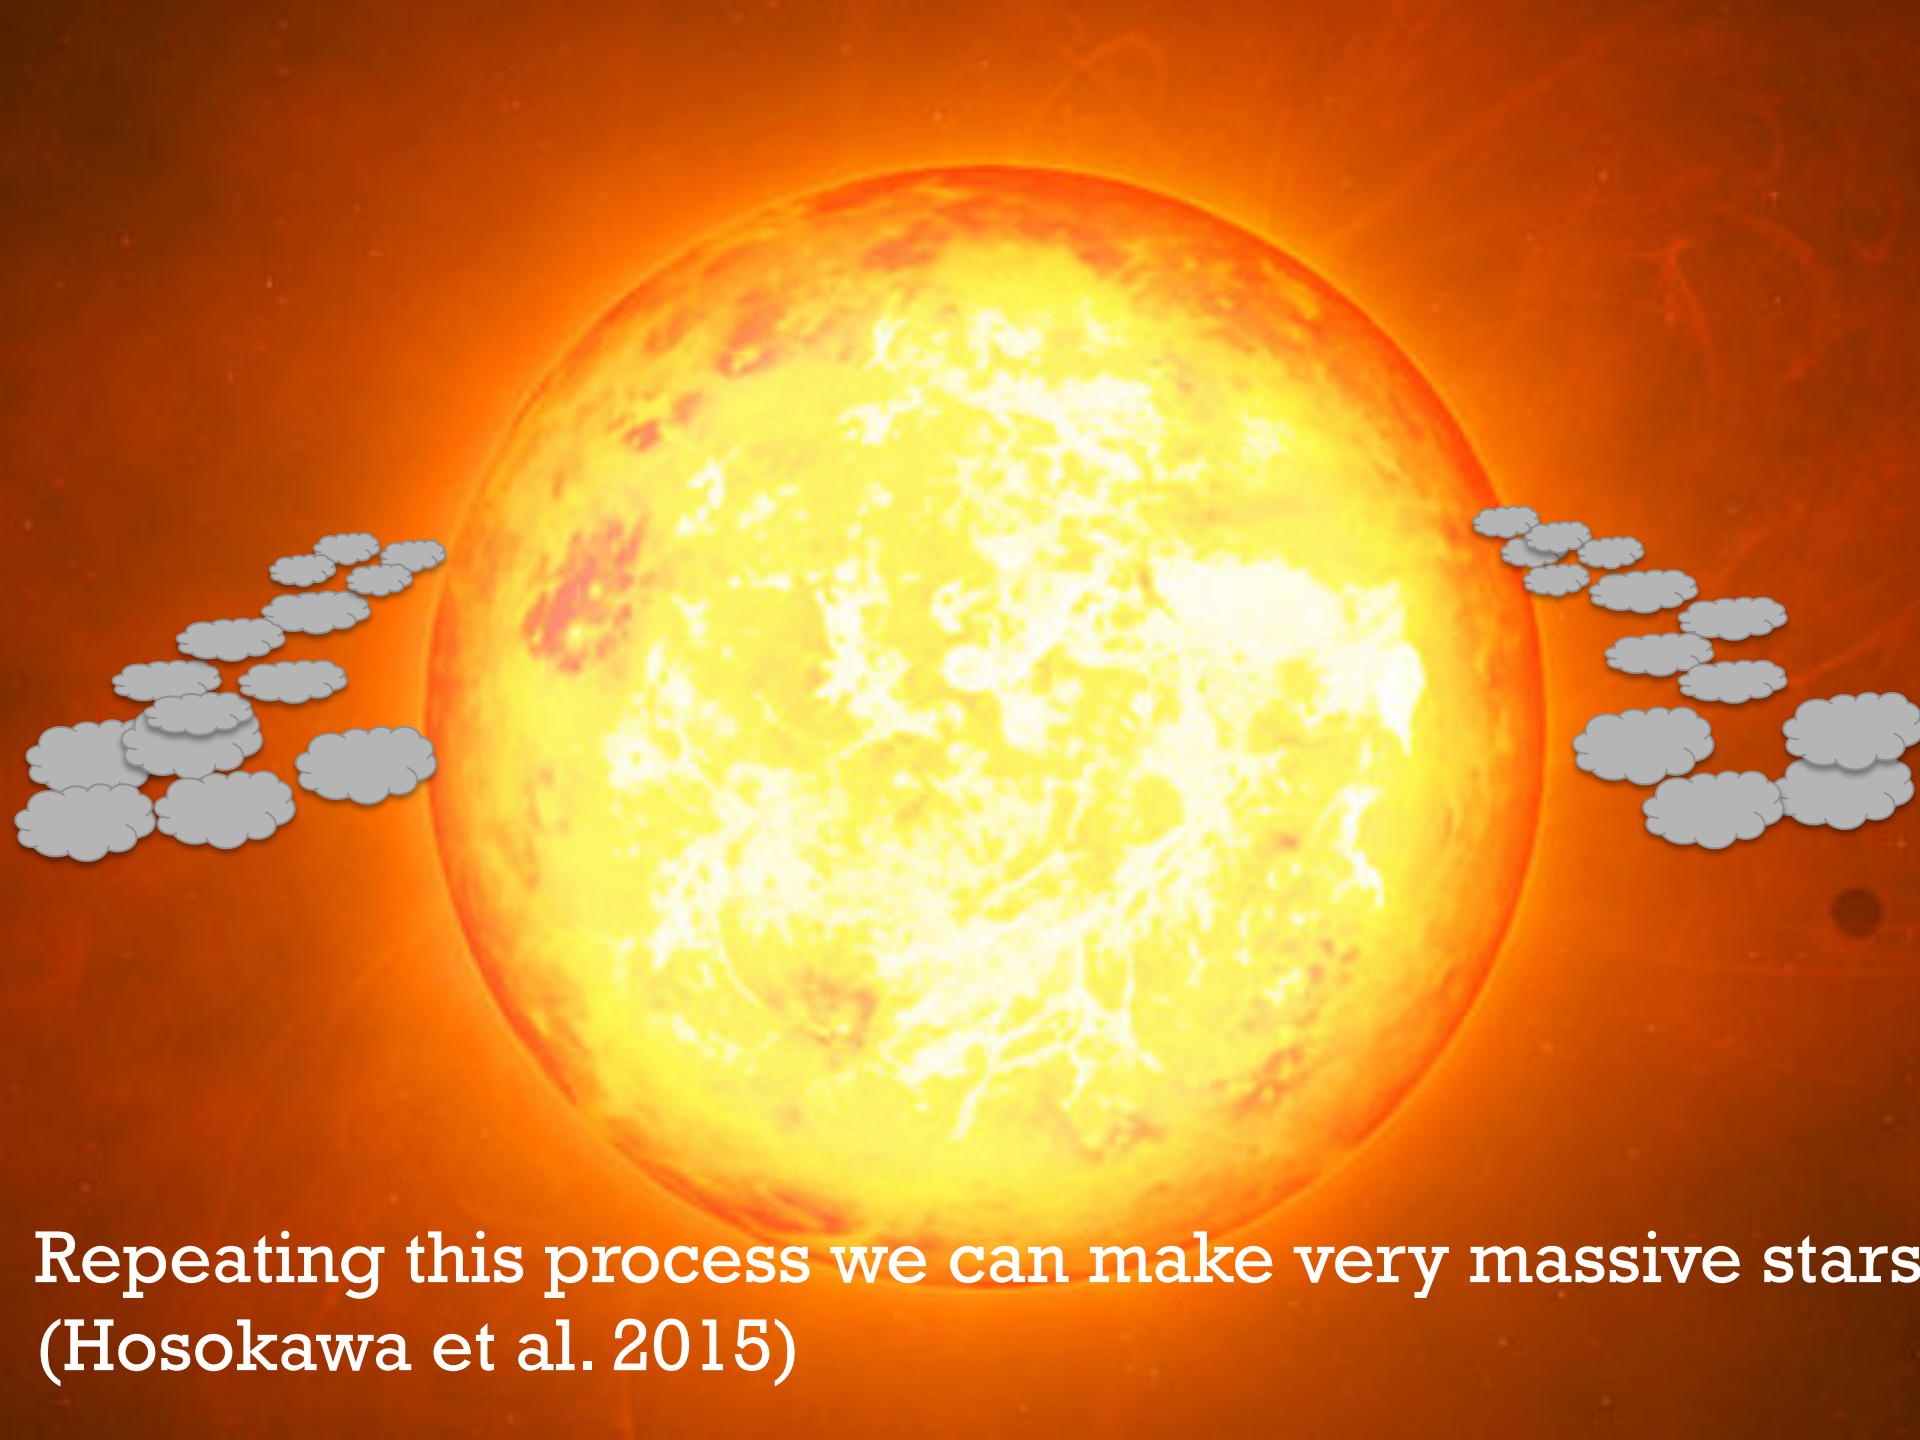
After 10^4 years the star will contract gravitationally.
This pushes T_{eff} back up, restarting the UV radiation.



If another disk fragment is accreted before 10^4 the process repeats.

JIVE
Joint Institute for VLBI
ERIC





Repeating this process we can make very massive stars
(Hosokawa et al. 2015)

Path to solving the radiation pressure problem
Next:
Look for evidence of episodic accretion in MYSOs
Repeating this process we can make very massive stars

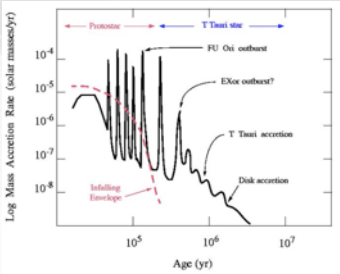
Conclusions

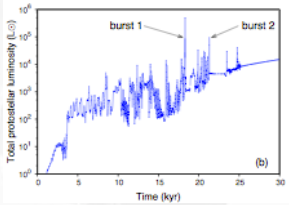
- Episodic accretion established for low mass YSOs

Solves luminosity problem

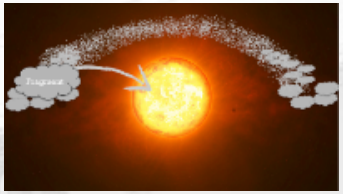


In Massive stars:

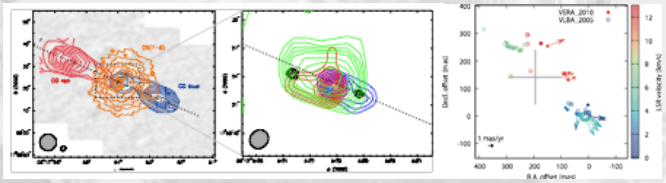
- Simulations predict episodic accretion on $<10^4$ yr timescales



- **Radiation pressure** problem solved by Bloating ($<10^4$ yr)



- VLBI reveals episodic ejection in two **MYSOs**, S255IR and AFGL5142, <u>$<10^4$ yr timescales</u>



?"MUors"?
